## *Participate in a study of social-emotional development in Noonan syndrome!*

The purpose of this IRB-approved research study is to investigate social development in children and adolescents with Noonan syndrome (ages 8-16) and their siblings who do not have NS. We are interested in studying the impact of emotional health and behaviors on development of interpersonal relationships.

Families of individuals with Noonan syndrome are invited to participate by completing a set of questionnaires about their child and family functioning.
